LOOMETTE KING PATTERN WEAVE PLACE MATS

The instructions contained herein are for weaving advanced patterns, supplemental to the detailed instructions and diagrams, as published in our LOOMETTE KING MANUAL.

In pattern weaving it is necessary to count the weave rows in order to weave any desired pattern in its proper sequence.

For convenience the rows on the LOOMETTE KING are numbered to enable the weaver to follow patterns at all times.

For all of the following directions and illustrations, numbers 1 to 8, thread the loom for the loomette weave as described in the direction sheet. Materials used: Interwoven metallic straw, plain straw, 7/1 pure linen, metallic or plain nylon or other similar weight yarns of rayon or cotton.

Plain straw can be used with excellent results wherever metallic straw has been indicated in these patterns.

IMPORTANT:

In Pattern Weaves Nos. 2 to 8 inclusive, it is necessary to push the (U3-O3) and (O3-U3) grouping of threads together to form a lacey effect as is illustrated on cover. This should be done with the weaving needle before removing mat from the loom.

METHOD USED TO STRAIGHTEN THE HORIZONTAL THREAD:

After you have woven the first row and pulled the thread across, continue

to weave the second row until you have woven approximately one-half of a row. Leave the needle in and with a smaller 6-inch needle or a steel knitting needle, push down on the horizontal needle until it is in position as shown in picture No. 9 on the back page. Continue to weave the rest of the row and repeat this procedure on each row woven. This will aid the weaver materially in keeping the thread in a straight horizontal position.

The vertical threads should be straightened at the same time. The first thread must be kept as close to the pins as possible all the way around the loom and the following threads placed in their proper positions.

With some types of yarn when a plain weave is used in the main body of the mat or panel, there may be a tendency as weaving progresses for the previous woven strands to ride up in the center of the panel which causes the weaving needle to also ride up at an angle. To correct this condition it is necessary to push the lower threads further down toward the bottom of the loom with a smaller needle before pressing the larger needle toward the bottom so that all of the horizontal threads will be in proper exact horizontal position. This procedure may be slightly tedious for the novice, but with a little practice will become a very simple operation.

ABBREVIATIONS USED IN TEXT

PICTURE NO. 9

- P - indicates plain weaving to be done, i.e., the needle is passed under one thread and over the next for as many threads as the number following (P) indicates.
- U - indicates passage of needle **under** a thread or threads, as indicated by the number following.
- O - indicates the passage of needle **over** a thread or threads, as indicated by the number following.
- R - indicates the row.
- B - indicates basic or principal color.
- C - indicates contrasting color.
- T - indicates threading loom for weaving. (Example: "P across" means that you do plain weaving across one row, under one, over one. "P 2 - U3 - O1" means that you do plain weaving for two threads, then you pass the needle under three threads at a time, over one thread and repeat this sequence until the row is completed.)
